

Scenario:

You're a nail worker that works all day during the pandemic. You wanted to vote for the first time this year, but not sure how to do it safely and fast. Since you work all day, you would like vote online to avoid long lines and the risk of exposing to COVID.

Task 1: Create an account in order to vote for the app. (Note: I extended my prototype)

Task 2: Browse through the app and try to vote in the app after you created the account.

Task 3: After you voted, come back to the main screen and join a discussion. (Note: I extended my prototype)

Notes:

What changes I should make to my application:

- The "Pick Your Candidate" screen seems very confusing. There should a different page for each party candidates.
- The "You're Done" screen should tell the user what email the confirmation will be sent through in case they don't remember.
- The "Discussion" layout is very rough. It should be simplified in some way.

What changes I need to keep the same for my application:

- The minimal layout of the application.
- Everything is easily accessible in the main screen. There is no need to look around for a feature inside the application.
